

ABSTRACT OF THE DISCLOSURE

5 A plasma display panel is provided that has a good
productivity of partition formation and air exhaustion process
and realizes a bright and stable display. A discharge gas is
filled in a gap between two substrates. A mesh-patterned
partition is arranged on the inner surface of one of the
substrates for dividing the gap into plural squares
corresponding to a cell arrangement. The partition has low
10 portions for forming a mesh-like air path that travels all gas-
filled space enclosed by the partition in a plan view.
